In conducting this research, I want to know whether the Bamboo dancing method can help the students in improving their ability in reading or not. The subject of this research is the second grade of VIII 3 class of SMP Negeri 10 Gorontalo which consists of twenty three (23) students.

The method of this research is quantitative method and I apply by using pre-experiment design, it is use one group pre-test and post-test design. Data was gained from the reading test namely multiple choices which consist of 20 items.

In analyzing the data, I use normality analysis and hypothesis verification. Based on the result of t- testing the normality that the data of research is normal distribution. The hypothesis is tested by using t-test formula. It is found that the $t_{count}$ is 19.96, while $t_{list}$ in the level of significance $\alpha=0.05$. The degree of freedom (df) = (23+23-2)=44 is 2.02. This result shown that the hypothesis of this research is received, it means that Bamboo dancing method can improve students’ ability in reading.

Key words: Reading ability, Bamboo Dancing Method
